**THE MOST IMPORTANT CHARACTERISTICS OF THE STRONG  
GROUND MOTION DATA IN IRAN IN THE YEAR 2009**

**Received:** 10 March 2011, **Accepted:** 5 September 2011

**ABSTRACT**

During January – December 2009 more than 219 accelerograph records were recovered from permanent Iran strong motion stations operated by the Building and Housing Research Center. Accelerograms were recovered from ISMN triggered by 159 earthquakes in the magnitude 2.6 to 5.5 range. 21 Of these recording are related to the 17 October 2009 South of Tehran earthquake.

Peak ground acceleration was recorded in Bandar Abbas station about 478 cm/s/s on November 3, 2009 earthquake.

**Keywords:** Accelerogram; accelerograph; earthquake; strong motion; peak ground acceleration

**1. INTRODUCTION**

The Iranian plateau is one of the seismically active areas of the world and frequently suffers destructive earthquakes that cause heavy loss of human life and widespread damage. Safeguarding life and property from destructive effects of earthquakes is a major national as well as world-wide problem. Earthquake strong motion data provide the basis for design of engineered buildings, bridges, dams and other critical structures as well as the basis for research on fundamental problems related to earthquake processes, and internal structure of the earth. Strong motion instrumentation program in Iran is operated by ISMN.

Iran Strong Motion Network (ISMN) started its activities in 1973 at the former Planning and Budget Organization. In 1981, the ISMN was transferred to BHRC and a new phase of its activities began. Until 1992, the ISMN had 274 analog accelerographs. At the present time (August 2011) ISMN has 1156 digital accelerographs. More than 7841 three component accelerograms have been recorded by these instruments.

## 2. STRONG MITION DATA IN 2009

During January – December 2009, more than 159 earthquake triggered 128 accelerographs, among them 48 earthquakes had magnitude greater than 4 (Figures 1 and 2). In addition, more than 219 accelerograms were recovered from the permanent Iran Strong Motion Network, operated by the Building & Housing Research Center (Figure 3). Amongst these the Tomban (Qeshm Island) earthquake of 22th July. 2009, with  $M_w 5.5$  was the greatest one. The main shock of this earthquake triggered 3 accelerographs. Its maximum PGA was about 378 gals that was registered by Tomban station, but the highest acceleration in this period recorded at Bandar abbas station in the event of November 3rd 2009. The strong motion and seismological data of important accelerograms are listed in the appendix table.

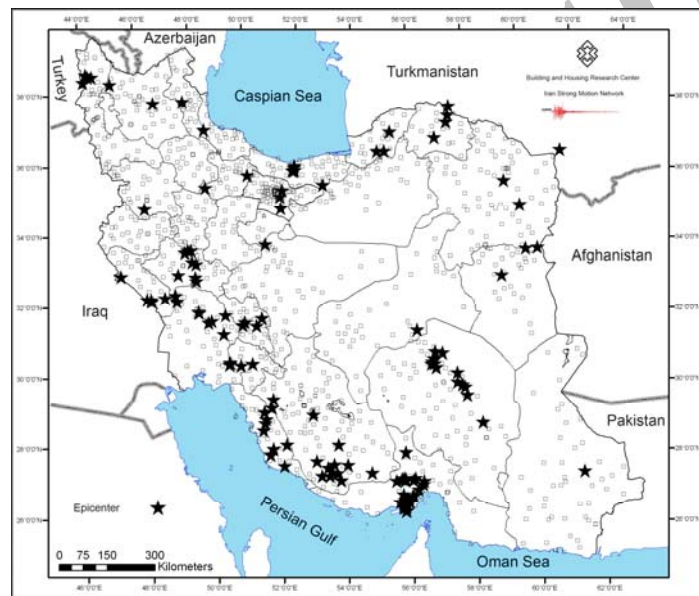

Figure1. The epicentres of the earthquakes with magnitude  $>4$  in 2009

Figure 2. The number of the earthquakes with magnitude  $>4$  in 2009

Figure 3. The number of accelerograms recorded in 2009

In appendix table we classify the information collected for each entry in the database under three headings: (1) Earthquake information (date, epicentral coordinates, magnitude, and depth), (2) Station information (coordinates, location, ID, altitude) and (3) record information (trigger times, peak ground motion amplitudes of each waveform). The earthquake information was obtained from both national and international seismic agencies. We processed all records with  $M \geq 4$ , and only for these records PGV, PGD and spectral quantities were computed because ground motion records of events with smaller magnitudes are unlikely to be significant for engineering use. The most important earthquakes in 2009 are listed in below.

#### 2.1 Qadrooni dam area earthquake of February 15<sup>th</sup>, 2009

On February 15<sup>th</sup>, 2009 at 21:22:20 (UTC), an earthquake with Mw4.9 (BHRC), M4.9 (IGTU) and M4.7 (IIEES), occurred near Qadrooni Dam (Kerman Province), South-East of Iran. This event was recorded by 3 sets of digital accelerographs (Figure 4) of Iran Strong Motion Network (ISMN). The uncorrected peak acceleration (43 cm/s/s) was recorded in Qadrooni Dam station. The epicenter of this event was located in 31.10N, 57.07E (BHRC), 31.09N, 57.03E (IGTU), 31.06N, 57.00E (IIEES) and 31.07N, 57.07E (NEIC).

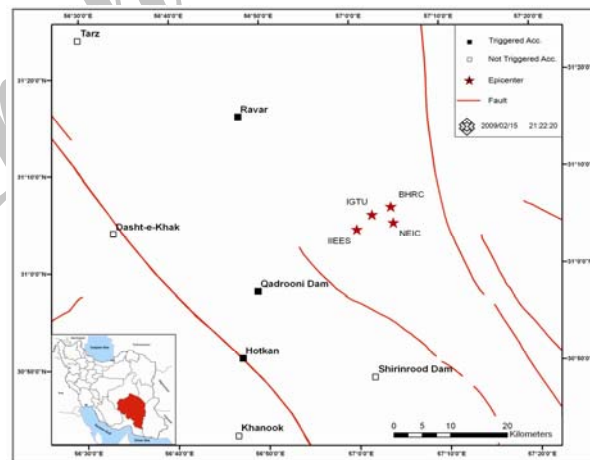

Figure 4. The location map of February 15<sup>th</sup>, 2009 Qadrooni dam area earthquake and the triggered stations

### 2.2 Hotkan earthquake of March 7th, 2009

On March 7<sup>th</sup>, 2009 at 06:47:07 (UTC), an earthquake with Mw4.4 (BHRC), Mn4.3 (IGTU), Ml4.1 (IIEES) and mb4.1 (NEIC) occurred near Hotkan town (Kerman Province), South-East of Iran. This event was recorded by 3 sets of digital accelerographs of Iran Strong Ground Motion Network (ISMN). The uncorrected peak acceleration (100 cm/s/s) was recorded in Hotkan station (Figure 5). The epicenter of this event was located in 30.81N, 56.70E (BHRC), 30.86N, 56.73E (IGTU), 30.79N, 56.77E (IIEES) and 30.79N, 56.77E (NEIC). On February 22nd, 2005 a magnitude 6.4 earthquake occurred at epicentral area of Hotkan earthquake. At least 602 people killed and 991 injured in Zarand earthquake.

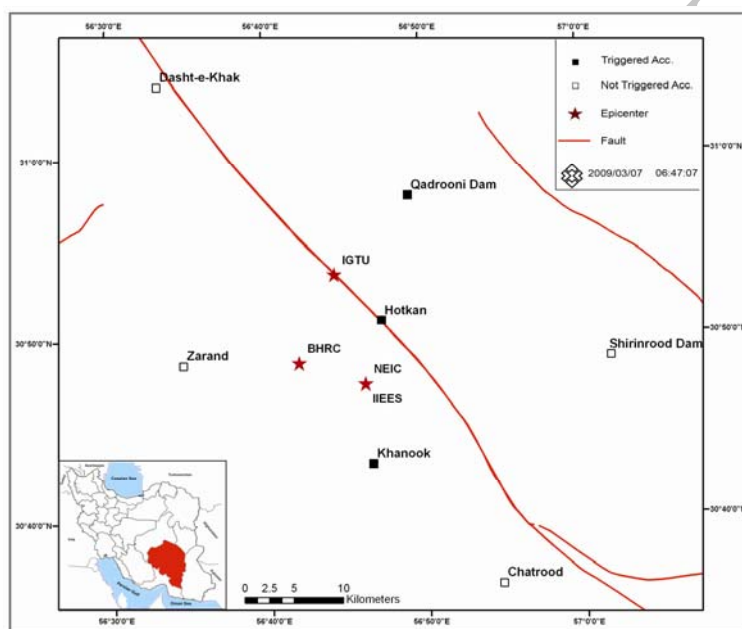

Figure 5. The location map of March 7<sup>th</sup>, 2009 Hotkan earthquake and triggered stations

### 2.3 Sirch earthquake of May 11th, 2009

On May 11<sup>th</sup>, 2009 at 02:14:06 (UTC), an earthquake with Mw4.5 (BHRC), Mn4.9 (IGUT), Ml4.8 (IIEES) and mb4.1 (NEIC), occurred near Sirch town in Gowk valley (Kerman Province), South-East of Iran. This event was recorded by 6 sets of digital accelerographs (Figure 6) of Iran Strong Motion Network (ISMN). The uncorrected peak acceleration was recorded in Sirch station (153 cm/s/s). The epicenter of this event has been located at 30.27N, 57.54E (BHRC), 30.33N, 57.64 (IGUT), 30.29N, 57.51E (IIEES) and 30.29N, 57.51E (NEIC). Gowk valley is one of the most seismically active areas in Iran. This area has experienced more than 5 large earthquakes in the past 32 years. The corrected time histories of acceleration, velocity and displacement have shown in figures 7-9. Acceleration Response spectrum of this record shows predominant period about 0.1 sec on horizontal component and 0.08 (sec) on vertical component (Figure 10).

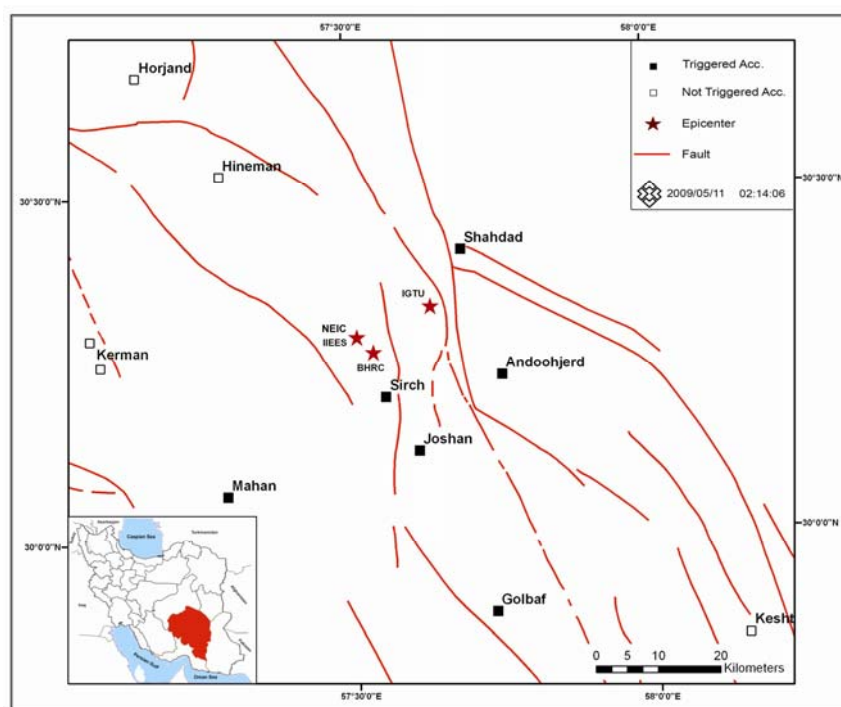

Figure 6. The location map of May 11<sup>th</sup>, 2009 Sirch earthquake and the triggered stations

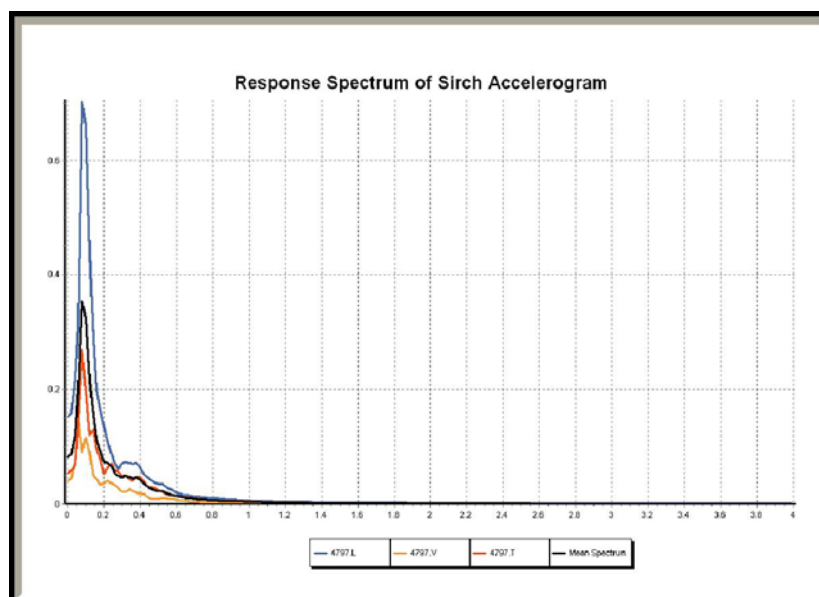

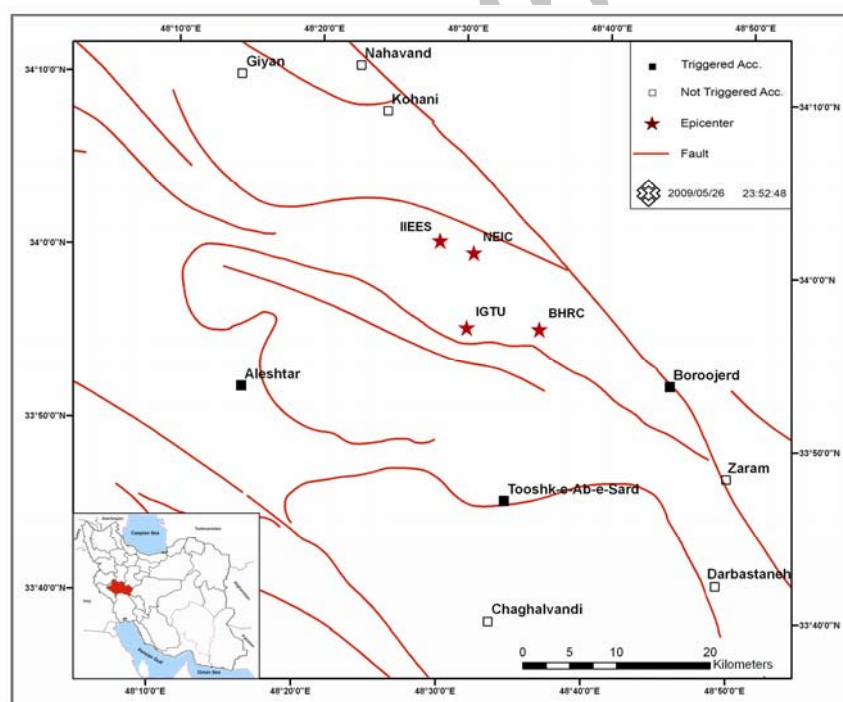

Figure 10. Response spectrum of the Sirch accelerogram

Figure 11. The location map of May 26<sup>th</sup>, 2009 Tooshk-e-Ab-e-Sard earthquake and the triggered stations

#### 2.4 Tooshk-e-Ab-e-Sard Earthquake of May 26th, 2009

On May 26<sup>th</sup>, 2009 at 23:52:48 (UTC), an earthquake with Mw4.6 (BHRC), Mn4.8 (IGUT), Ml4.7 (IIEES) and mb4.7 (NEIC), occurred in the North of Tooshk-e-Ab-e-Sard town (Lorestan Province). This event was recorded by 3 sets of digital accelerographs of Iran Strong Ground Motion Network (Figure 11). The uncorrected peak acceleration was recorded in Tooshk-e-Ab-e-Sard station (65 cm/s/s). The epicenter of this event has been located at 33.94N, 48.60E (BHRC), 33.94N, 48.52 (IGUT), 34.02N, 48.48E (IIEES) and 34.01N, 48.52E (NEIC).

#### 2.8 Tomban Earthquake of July 22th, 2009

On July 22<sup>th</sup>, 2009 at 03:53:03 (UTC), an earthquake with Mn5.4 (IGTU), mb5.5 (IIEES) and mb5.5 (NEIC), occurred near Tomban village (Qeshm Island), in the south of Iran. This event was recorded by 3 sets of digital accelerographs (Figure 12) of Iran Strong Motion Network (ISMN). The uncorrected peak acceleration was recorded in Tomban station (378 cm/s/s). The epicenter of this event has been located at 26.89N, 55.61E (IGTU), 26.83N, 55.78E (NEIC) and 26.77N, 55.79E (IIEES). In the recent years, Qeshm Island, the largest Island in Persian Gulf has experienced some moderate earthquake with magnitude between 5 and 6. The Tomban station in central of Qeshm Island has recorded more than 102 event until July 22th, earthquake. This event was the largest earthquake which occurred in Iran in 2009. The corrected time histories of acceleration, velocity and displacement have shown in figures 13-15. Acceleration Response spectrum of this record shows predominant period about 0.12 sec on horizontal component and 0.1 (sec) on vertical component (Figure 16).

Figure 15. Time histories of Acceleration, velocity and displacement of T component of the Tomban record

Figure 16. Response spectrum of the Tomban accelerogram

### 2.5 Shahr-e-Rey Earthquake of October 17th, 2009

On October 17<sup>th</sup>, 2009 at 10:53:57 UTC an earthquake with a magnitude of Mw3.8 (BHRC), Mn4.0 (IGTU) and M13.9 (IIEES) occurred in Tehran Province. This event was recorded by 21 sets of accelerographs (Figure 17) stations of ISMN and the maximum uncorrected acceleration of about 28 cm/s/s has been recorded in Tehran13 station. BHRC estimated the epicenter on 35.58N, 51.59E and the magnitude of this event to be Mw3.8 and M14.2 using the available data. This event was also located to be at the coordinates of 35.57N, 51.50E (IGTU) and 35.50N, 51.59E (IIEES).
