

A CONTRIBUTION TO THE FLORA OF QESHM ISLAND, IRAN

F. Attar, B. Hamzeh'ee & A. Ghahreman

Attar, F., Hamzeh'ee, B. & Ghahreman, A. 2004 10 10: A contribution to the flora of Qeshm Island. -*Iran. Journ. Bot.* 10 (2) : 199-218. Tehran.

Qeshm island with an area of 1445 km² is the largest island in the Persian Gulf situated alongside the Hormozgan province coast, stretching from Bandar Abbas to the Khamir port. Of the vegetation in the island, one can mention the mangrove forest on the northern shores of the island in Laft and Tabl districts, halophyte plant associations and psamophyte-halophyte vegetation on the eroded terraces and the dry woodlands. In this paper 314 native species in the island are listed of which 74 species have, as yet, not been recorded in any other Qeshm documents. Classification based on biological types indicates that the therophytes and chamaephytes make up the largest percentage of the plants. From the chronological point they also exhibit the largest percentage of Saharo-Sindian elements.

Farideh Attar & Ahmad Ghahreman, Central Herbarium of Tehran University, Faculty of Science, Tehran University. -Behnam Hamzeh'ee: Research Institute of Forests and Rangelands, P. O. Box 13185-116, Tehran, Iran.

Key words. Flora, Qeshm, Iran.

مقدمه‌ای بر فلور جزیره قشم

فریده عطار، بهنام حمزه و احمد قهرمان

جزیره قشم بزرگترین جزیره خلیج فارس با وسعت ۱۴۴۵ کیلومتر مربع در راستای سواحل استان هرمزگان از بندر عباس تا بندر خمیر قرار دارد. از رویشهاهای اصلی آن می‌توان به جنگلهای مانگرو در سواحل شمالی جزیره در مناطق لافت و طبل، جوامع هالوفیت، رویشهای شن‌رست - نمک دوست، رویشهای تراسهای در حال فرسایش و درختزارهای خشک اشاره کرد. در این مقاله حدود ۳۱۴ گونه بومی جزیره قشم لیست شده است که تعداد ۷۴ گونه آن تا کنون در دیگر منابع موجود برای جزیره ذکر نشده است. تقسیم‌بندی تیپهای بیولوژیکی مؤید آن است که تروفیتها و کامفیتها بالاترین درصد را داشته و از نظر کورولوژی نیز عناصر صحراء - سندی بالاترین درصد را دارند.

Introduction

Qeshm is the largest island in the Persian Gulf situated near the straits of Hormoz south of Bandar Abbas. The Qeshm island with its unique natural characteristic is geographically situated at 55 to 57 degrees longitudinally and 25 to 27 latitudinally. Its surface area is 1445 km², its circumference is about 262 km and its length is about 122 km. One third of the island is flat and the rest is more or less mountainous. Altitude varies from 0 to 397 m above sea level. The dominant weather is tropical and the temperature throughout the year always stays a few degrees above zero. The island's climate is characterized by a long warm season, often extraordinary hot, high relative humidity, and a short temperate season. According to statistical data collected by the weather station in recent years (table 1), the warm humid weather starts in early March and ends in November.

Despite its uniform climate, the island has a variety of plant associations and plant habitats whose pattern of distribution is influenced by the soil, physiography, availability of water, and the extent of the soil salinity. The island's major vegetation are as follows: mangrove forests, halophyte vegetation, psammophyte-halophyte vegetation, vegetation on the eroding terraces and the arid woodlands (Ghahreman & al., 2000).

Till now there has not been no comprehensive studies concerning the island's vegetation and flora. Kunkle (1977) listed some plants from the island. In Flora Iranica (Rechinger 1968-1998) 74 species recorded from the island, collected by various botanists. In this paper, the island's plants are listed and their locations are cited. The biological types of the species and their chorology have been classified based on their presence in Iran and the island.

Materials and Methods

This paper is part of the Qeshm island flora and vegetation project which has carried out during 1992-1997 (Hamzeh'ee 1995) (Ghehreman, Hamzeh'ee and Attar 2000). To conduct the research, plants in the island were collected during the four seasons in different years and were then transferred to Tehran University Central Herbarium. The collected plant species were named based on the regional Floras such as Flora Iranica (Rechinger 1963-1998), Flora of Iran in colour (Ghahreman 1978-2002), Flora of Iran (Assadi & al. 1988-2004), Flora Palaestina (Zohary 1966-1986), and Saudi Arabia (Collenette 1985). Biological types have been determined on the basis of the Raunkier classification (Raunkier 1934) and the species chorology using Leonard studies on the central and southern deserts in Iran (Leonard 1981-1989, 1993). In the Leonard studies (1989) the Saharo-Sindian region in Iran is given a number of subdivisions called ,Arabo-Sindian, Nubo-Sindian, Irano-Sindian. In this paper these subdivisions have been disregarded in favor of a general division called Saharo-Sindian. Plant specimens marked by an asterisk taken from the literatures and two asterisks are the first report from the island. Based on ecological factors 35 different habitats were recognized in the island (table 2). The habitats of species are shown in table 3. In this table, abbreviations of life forms and chorological types are presented. The abbreviations are shown in tables 5 and 6. The pluri-regional species three phytogeographic regions. The specimens were collected by A. Ghahreman, F. Attar and B. Hamzeh'ee.

Results and discussion

Floristic list of the Qeshm Island is presented in table 3. In the list, 314 species and subspecies of vascular plants in 202 genera and

Table 1. Climatic informations of Turian station.

Clima. Param.	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.

Table 2. List of plant habitats

1. Margin of roads, salt inlands and in the disturbed areas with heavy soil and moderately low water table.
2. Flat plains with low water table.
3. Flat plains and ruderal outskirts with low water table.
4. Woodlands occurring on high coastal sands and sandy hills.
5. Low-lying woodland in lowlands of seasonal rivers and floodways surrounded by terraces and eroding hills.
6. Intertidal zone.
7. Seasonal rain channels and on the eroding hills.
8. River basins and seasonal rain channels.
9. Pure and spotty stands in lowlands where water collect.
10. Gradually slanted hills and sandy uneven lands with low water table.
11. Completely sandy lands with low and moderately low water table.
12. Areas surrounded by terraces with relatively low water table.
13. Low -lying, flat lands reaching low eroding hills and somewhat salty areas within the inland with very low water table.
14. Sandy lands and gradually slanted hills with low water table.
15. Coastal salt marsh as high as saline lands inside the island with relatively high water table.
16. Flat lands as far as low coastal hills creating pure stands which appears as patches with low water table.
17. Lowlands where rain water collected and on the banks of the seasonal ponds.
18. Uneven completely sandy coastal lands and low sandy hills with relatively low water table.
19. Natural woodlands , in sandy flat plains.
20. Clumps of trees and bushes alongside seasonal river basins.
21. Eroding hills and rocky places with low water table.

22. Low-lying open fields, lands surrounded by eroding terraces with high to relatively low water table.
23. Eroding hills and dense sandy terraces with very low water table.
24. Low-lying lands with high water tables and low-elevation hills and lands with light to somewhat heavy soil texture.
25. Lowlands between eroding terraces and flat plains with somewhat high water table.
26. Low-lying areas with moderately high water table.
27. Low and salty lands near the sea coast and as far as saline inlands with low water table.
28. Sea coast and low sandy hills.
29. Damaged areas and low sandy hills with low water table.
30. Low salty coastal areas with high water table.
31. Around the villages and in abandoned lands with relatively low water table.
32. Sandy areas near the shores with relatively low water table which is little higher in some areas.
33. Ruderal places and roadsides.
34. Weedy gardens and wet places or farmlands.
35. Bukhu mountains.

58 families are recognized. Of this number, 74 species are reported in the island for the first time. The plant families in Qeshm consist of five familes of monocots, 51 families of dicots, and one family of Chlamidospermes. The largest famillies are the *Gramineae (Poaceae)* with 48 species, followed by *Papilionaceae*, *Compositae (Asteraceae)* and *Chenopodiaceae*, each with 36, 27 and 21 species respectively. Families consisting of up to eight species are presented in table 4. In terms of biological types, the therophytes and chamaephytes make up the highest percentage, which is indicative of high floristic adaptation to the island's desert and semi-desert like arid climate (table 5). Chorologically, plants of Saharo-Sindian region are more frequent (table 6).

Acknowledgments

We would like to express our thanks and appreciation to Mr. Sadat who at the time served as deputy managing director of Qeshm Free Zone, for his generous assistance without which this research would not have been achieved. We must also thank Dr. Mostafa

Assadi who showed enough patience to determine plants of *Tamaricaceae*, *Chenopodiaceae* and edit the text.
