

# A TAXONOMIC REVISION OF UTRICULARIA (LENTIBULARIACEAE) FOR AQUA FLORA OF IRAN

M. Dinarvand

Received 25.07.2012. Accepted for publication 05.09.2012.

Dinarvand, M. 2012 12 31: A taxonomic revision of *Utricularia* (*Lentibulariaceae*) for aqua flora of Iran. – *Iran. J. Bot.* 18 (2): 191-195. Tehran.

For the preparing of aqua Flora of Iran, the appropriate materials collected from wetlands and identified. Among *Urticularia* species one new record to Iran namely *Utricularia ochroleuca* from a bog in Mazandaran was found. Other species, *Utricularia minor* collected from Gahar lake in Lorestan, *U. vulgaris* from Zarivar lake in Kurdestan and *U. australis* from Gilan. In this paper a key to the Iranian species is presented and the new record and other species are explained.

Mehri Dinarvand (mdinarvand2003@yahoo.com), Research Center of Agriculture and Natural Resources of Khuzestan province & PhD Student of Ferdowsi University of Mashhad, Iran.

**Key words.** *Utricularia*, Aquatic flora, *Lentibulariaceae*, new record, Revision, Iran.

مروی تاکسونومیک بر جنس پشه گیر (تیره لتنی بولا ریاسه) از گیاهان آبزی ایران

مهری دیناروند، مریم پژوهش مرکز تحقیقات کشاورزی و منابع طبیعی خوزستان و دانشجوی دکتری دانشگاه فردوسی مشهد. طی نگارش فلور تیره‌های آبزی ایران و جمع‌آوری و شناسایی نمونه‌های گیاهی تالابها گونه *Utricularia ochroleuca* از ماندانی در استان مازندران برای ایران معرفی می‌شود. سه گونه دیگر از این جنس در ایران وجود دارد که طی بررسی‌های اخیر گونه *U. minor* از دریاچه گهر در استان لرستان، *U. vulgaris* از دریاچه زریوار استان کردستان و گونه *U. neglecta* که البته در فلور ایرانیکا معرفی شده بود از استان گیلان جمع‌آوری شد. در این نگارش کلید شناسایی گونه‌های ایران و شرح گونه‌ها ارائه می‌شود.

## INTRODUCTION

The members of the family *Lentibulariaceae* are carnivorous herbs that is placed in the order *Lamiales* (Judd et al. 2008). It contains 284 species of three genera, *Pinguicula* L., *Genlisea* St. Hil. and *Utricularia* L.

*Utricularia* is a cosmopolitan genus with concentration on tropical and subtropical regions. It includes 214 species in two subgenera *Polypompholyx* Lehm. and *Utricularia* L. (Taylor 1989). Casper (1969) surveyed this family in Flora Iranica only with *U. neglecta* Lehm. from Mazandaran province. Parsa (1950) in Flore de l'Iran introduced this family with species *U. vulgaris* from same province although this might be an erroneous detection (Naqinezhad 2008).

Casper (1969) in Flora Iranica reported three species namely *U. minor*, *U. ochroleuca* and *U. vulgaris* from Afghanistan and *U. vulgaris* for Pakistan. Naqinezhad et al. (2008) reported the species *U. australis* from Tehran and *U. minor* from Tehran and Mazandaran for the first time and although they refer Tehran University Herbarium as stored but in this research, I did not find their specimens in TUH. Ali (1993) in Flora of West Pakistan explained that *U. vulgaris* does not occur in Pakistan and material belongs to *U. australis*, also other species in this region are, *U. minor* and *U. aurea*. The

family *Lentibulariaceae* have 2 genera in Turkey and Europe, *Pinguicula* and *Utricularia*. There are three species of *Utricularia* in Turkey and six in Europe, on the other hand three species (*U. minor*, *U. australis* and *U. vulgaris*) are common between Turkey, Iran and Europe. But it is important to mention that, the species of Turkey are very similar in characters with Iranian species (Davis 1978; Taylor 1972). In Flora of the U.S.S.R. (Komarov 1958) six species of *Utricularia* encountered, three of them are the same as in Iran, *U. minor*, *U. vulgaris* and *U. major*. The author has been preparing the draft of aqua Flora of Iran and therefore has been collecting and revising the genus *Utricularia* in Iran. The aim of this paper is to presenting an identification key for the Iranian species and explaining the new record to Iran.

## RESULTS

### Key to *Utricularia* species in Iran

- |   |                                |
|---|--------------------------------|
| 1. Stems dimorphic, Leaves polymorphic  | 2                              |
| - Stems and leaves monomorphic  | 3                              |
| 2. Leaves indistinctly denticulate or not denticulate; all segments dichotomously divided | <b>1. <i>U. minor</i></b>      |
| -Leaves distinctly denticulate; segments dichotomously and pinnately divided              | <b>4. <i>U. ochroleuca</i></b> |
| 3. Leaves multipinnatipartite. Internode 1-1.5 cm.  |                                |

- Pedicels 1-1.5 cm. Lower lip flat and spreading  
**2. U. australis**  
- Leaves pinnate. Internode 4-8 mm. Pedicels 0.5-1 cm.  
Lower lip flat and deflexed                           **3. U. vulgaris**

**1. U. minor** L., Sp. Pl. 18 (1753).

*Specimen examined.* Lorestan province: Doroud, Gahar lake, 2358 m, Dinarvand & Mohamadi. 8757 (TARI and Research Center of Agriculture & Natural Resources of Khuzestan Herbarium).

Submerged herbs. Stems filiform, dimorphic; green and colourless internode 4-7 mm. Leaves alternate, polymorphic, with 2 primary segments from the base, 2-10 mm long, semiorbicircular in outline; secondary segments dichotomously divided into 2-5 segments, narrowly linear, 0.2-0.3 mm wide, margin entire or sparsely denticulate, apex acute. Traps on leaf segments, with short stalk, 0.2 mm, oblique ovate, 1.5-2 wide and 0.9-1 mm long. Antennae on mouth of traps much branched, 2 mm long.

**2. U. australis** R. Br., Prodr.: 430 (1810), Fig. 1.  
Syn.: *U. neglecta* Lehm., Index Schol. Hambg. Gymn. Acad. 38 (1828).

Taylor (1989) in "The Genus *Utricularia*" introduced the species *U. neglecta* Lehm. as a synonym of *U. australis* R. Br.

*Specimens examined.* Mazandaran province: Fereydon Kenar, Azbaran village, -5 m, Dinarvand & Mohamadi. 8797 (TARI. Research Center of Agriculture & Natural Resources of Khuzestan Herbarium). Gilan province: Anzali wetland, Mobayen (Herbarium of Tehran University); Lahijan, 2 km S. Khazar, Amir Kalayeh wetland, Moradi, 1529. (Research Center of Agriculture & Natural Resources of Gilan & Khuzestan Herbarium)

Submerged herbs. Stems filiform, monomorphic, all green; internode 1-1.5 cm. Leaves alternate, monomorphic, with 2 primary segments from the base, 1-1.5 cm wide and 2.5-3.5 cm long, oblong to ovate in outline; secondary segments filiform, more than 10, multipinnately divided, margin denticulate, obviously with bristle on each tooth, oblong to ovate in outline. Traps on leaf segments, with shortly stalk, 0.2-0.4 mm, oblique ovate, 1.5 mm wide and 1.5-2 mm long. Antennae on mouth of traps much branched, 2-3 mm long. Inflorescent raceme; peduncle emerged, erect, 10-20 cm. Bracts amplexicaul, rounded at apex, 2-4 mm long. Flowers yellow, 5-7 mm long; pedicels 1-1.5 cm. Corolla bilabiate with spure; lower lip flat and spreading. Calyx with 2 dimorphic lobes, connate at base; the upper with rounded and the lower with

emarginated apex, 3.5 mm long. Capsule globose, 2-5 mm long.

**3. U. vulgaris** L., Sp. Pl. 18 (1753).

*Specimen examined.* Kurdestan province: Marivan, Zarivar lake, 1300 m, Dinarvand & Mohamadi 8312 (TARI and Research Center of Agriculture & Natural Resources of Khuzestan Herbarium).

Submerged herbs. Stems filiform, monomorphic, all green; internode 4-8 mm. Leaves alternate, monomorphic, with 2 primary segments from the base, 1-2.5 cm long, oblong to ovate in outline; secondary segments filiform, 5-7, pinnately divided; margin denticulate, obviously with bristle on each tooth, rounded to ovate in outline. Traps on leaf segments, with shortly stalk, 0.1-0.2 mm, oblique ovate, 2.5 mm wide and 3 mm long. Antennae on mouth of traps much branched, 2-3 mm long. Inflorescent raceme; peduncle emerged, erect, 6-10 cm. Bracts amplexicaul, rounded at apex, 3 mm long. Flowers yellow, 5-6 mm long; pedicels 0.5-1 cm. Calyx 2 with dimorphic lobes, connate at base; the upper with rounded and the lower with emarginated apex, 3 mm long. Corolla bilabiate with spure; lower lip flat and deflexed. Stamens 2; filament curved, 2 mm. Capsule globose, 2 mm long.

**4. U. ochroleuca** R. Hartman, Bot. Not. 1857: 30 (1857), Fig. 2.

*Specimen examined.* Mazandaran province: Beginning of the road from Chalos to Noshahr, under metal bridge, 8 m, Dinarvand & Mohamadi. 8787 (TARI. Research Center of Agriculture & Natural Resources of Khuzestan Herbarium).

Submerged herbs. Stems filiform, dimorphic; internode 4-7 mm. green and colourless. Leaves alternate, polymorphic, with 2 primary segments from the base, 3-10 mm long, oblong, ovate or semiorbicircular in outline; secondary segments dichotomously and pinnately divided, into 3-9 segments, narrowly linear, 0.1-0.6 mm wide, margin denticulate, obviously with bristle on each tooth; apex acute. Traps on leaf segments or on stems without leaf, with shortly stalk, 0.1-0.2 mm, oblique ovate, 1-2.5 wide and 1.5-2 mm long. Antennae on mouth of traps much branched, 2 mm long.

The Iranian species of the genus *Utricularia* are all non endemic aquatics with a distributed range between -5 to 2358 m altitudes in N and W Iran (Fig. 3).

## ACKNOWLEDGEMENT

Special thanks to Mr. Amin Parvizzadeh the leader of our team to Gahar Lake and Mr. Ghasem Ghafeli to

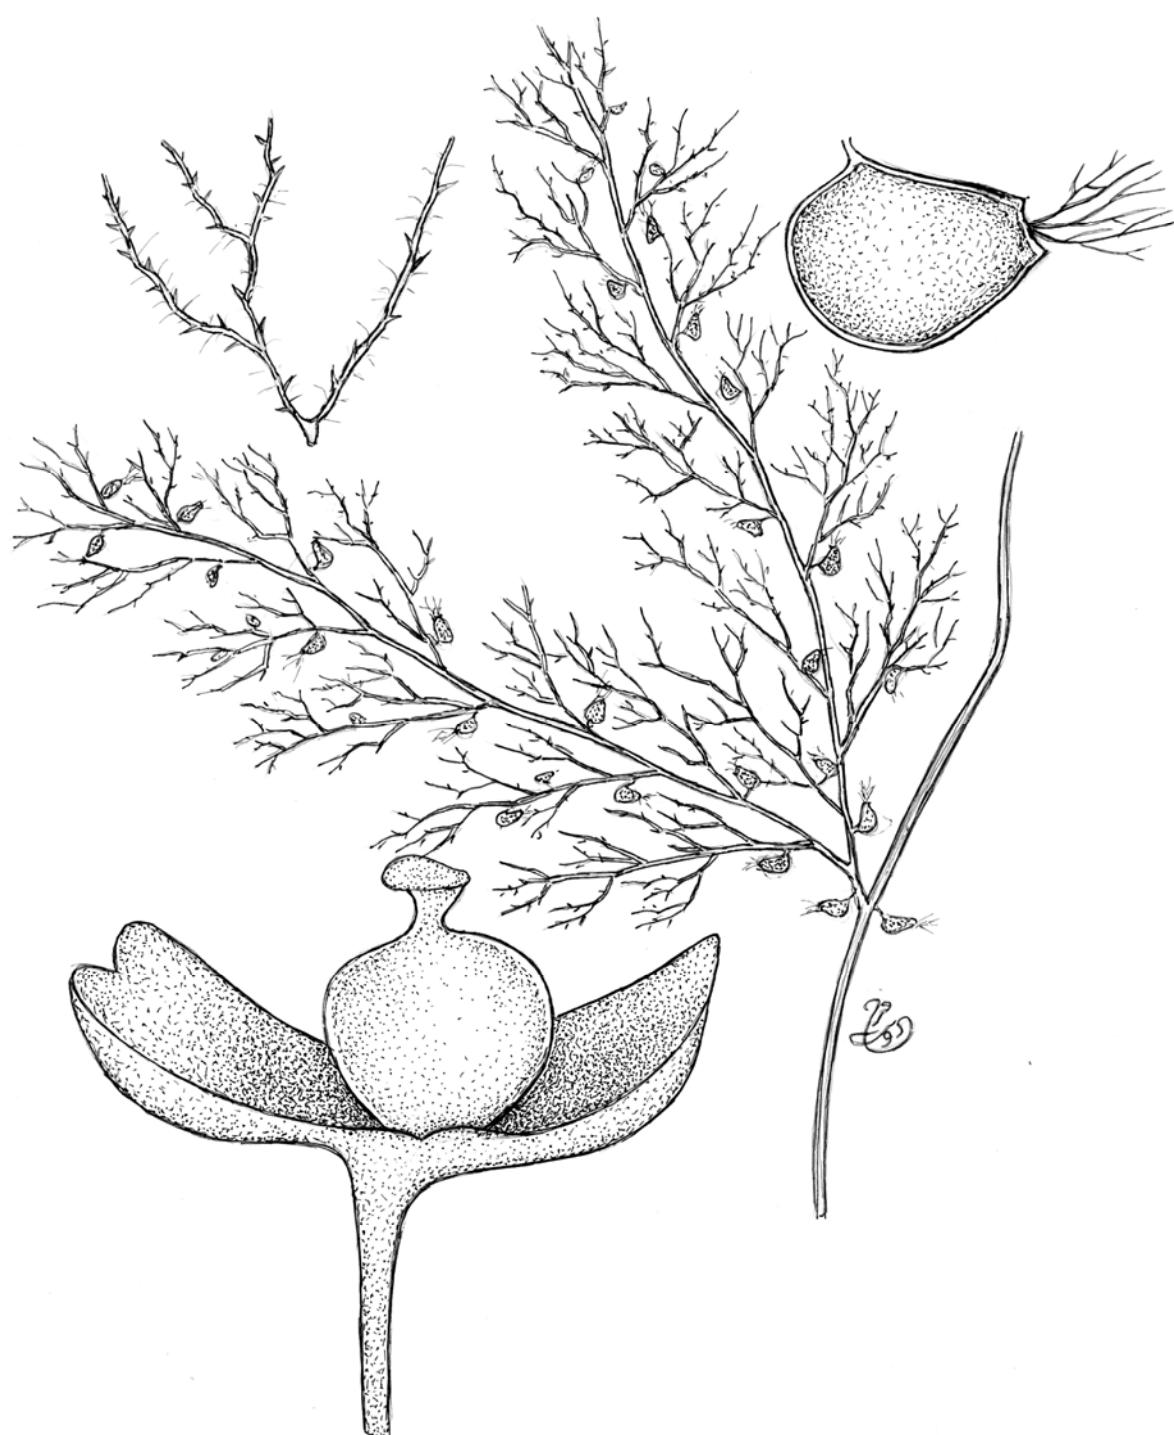

Fig. 1. *Urticularia australis* ( $\times 2.64$ ); trap ( $\times 26.4$ ); fruit ( $\times 7$ ).

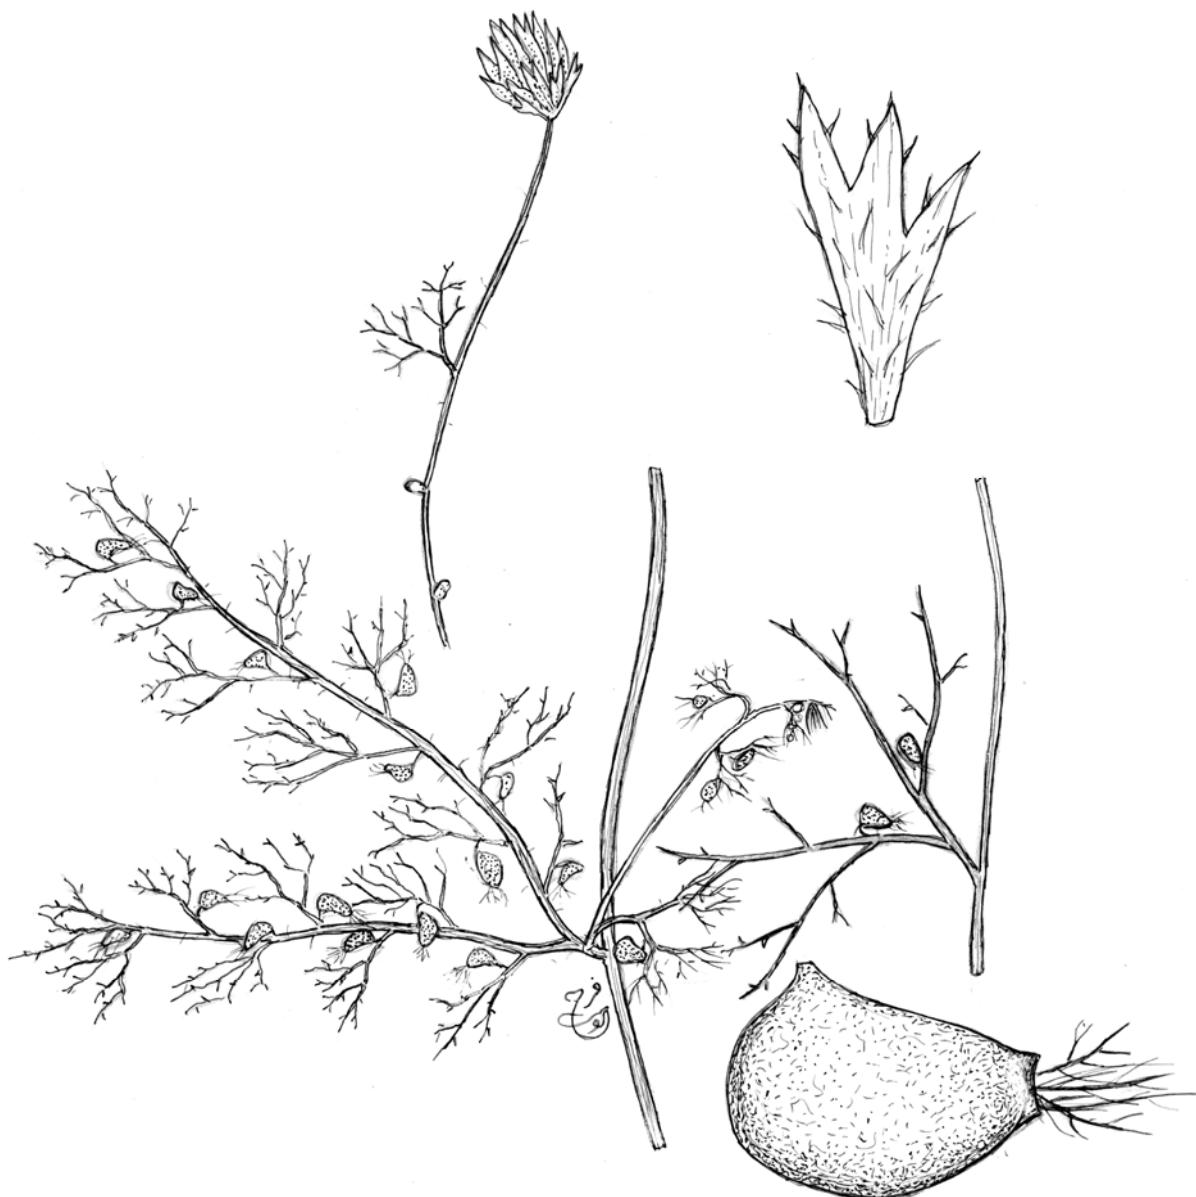

Fig. 2. *Utricularia ochroleuca*. Green stem ( $\times 5.3$ ); colorless stem ( $\times 13.2$ ); expanded turion leaf ( $\times 44$ ); trap ( $\times 12$ ).

useful helps during mission. Thanks to Mr. Moradi, from Research Center of Agriculture & Natural Resources of Gilan Herbarium for sending herbarium sheet. Thanks to Mrs. Farahdust, the artist of TARI herbarium for preparing the illustration.
