وسیع از اطراف سنندج، به خصوص شمال این شهرستان را سنگ‌های آتشفشانی و آذرآواری کرتاسه با ترکیب بازیک و حدواسط می‌سازند. مطالعات ژئوشیمیایی کالک آلکالن بودن ماگمای اولیه این سنگ‌ها را تایید می‌کند. آنومالی منفی Ti, Nb و نیز غنی شدگی از عناصر گروه LIL و LREE حاکی از این است که ماگمای مادر این سنگ‌ها از یک گوشته غنی شده (نسبت به گوشته مورب) در بالای یک زون فرورانش منشا گرفته است. همچنین نسبت پائین Nb/U و Ce/Pb در این سنگ‌ها در مقایسه با MORB و OIB نیز وابستگی این سنگ‌ها را با محیط‌های فرورانش یاد آوری می‌نماید.

### Legend

Quaternary	Qtr	Quaternary Deposits (alluvial, Deluvial)
Tertiary	Plms	Claystone, sandstone and gypsum
	Pef	Claystone, sandstone with claceros interbedded
	EV	Eocene volcanic(basalt and andesite rocks)
Middle to Upper Cretaceous		Basalt, Andesite rocks
	Kussh	Limestone, Argillic limestone and black shale
	Ksfsh	Black shale
Jurassic	TRjvm	Marble, Phyllite, slate and minor volcanics
Paleozoic	Hmet	Greenshist and Amphibolite facies metamorphic rocks

Major Fault
