

The Effect of Different Warm-up Stretch Protocols on a 20-Meter Sprint in Trained Soccer Players

M.Joorke⁵

Azad University (Shabestar)

Abstract : The purpose of this study was to determine the effect of different static and dynamic stretch protocols on a 20-meter sprint. 97 male soccer players were randomly assigned to 4 groups. (i) Passive static stretch (PSS) (n=28), (ii) active dynamic stretch (ADS) (n=22), (iii) active static stretch (ASS) (n=24), (iv) static dynamic stretch (SDS) (n=23). All groups performed a standard 10-min. jog as the warm – up, followed by two 20-m sprints. The 20-m sprints were repeated after subjects performed different stretch protocols. The PSS and ASS groups had a significant increase in sprint period ($P \leq 0.05$), while the ADS group had a significant decrease in sprint period ($p \leq 0.05$). It was concluded that static stretching as part of a warm-up may decrease short sprint performance, while active dynamic stretching seems to increase 20-m sprint performance.

Key word:

Static, Dynamic, Stretch, Sprint performance.
