Abstract

In 1970, the sustainable development paradigm affected all of theories and strategies of urban development. In this way, urban planners and decision makers proposed different patterns and strategies to achievement of urban sustainable development, such as compact growth, community development, public transportation, Eco city, humanity city and pedestrian city. The pattern of urban corridor development is one of the strategies that its purpose is achieving to urban sustainable development. In this research urban corridor development has been investigated. The used method is descriptive – analysis and data analyzed by geography information system (GIS). The results show because of bokan have liner growth it have good potential to urban corridor development and this kind of growth can be a good framework to other aspects of urban sustainable development.
