PURPOSE and INTRODUCTION: tubes carry eggs tumors cancer is a malignant tumour that starts in the cells of the tubes carry eggs. Malignant means that it can spread, or metastasize, to other parts of the body. Our aim from present study was efficiency evaluation of pomegranate in the treatment and prohibition of tubes carry eggs.

METHODS: We did a systematic review of 23 studies identified by searching PubMed, Ovide, Elsevier and ProQuest. Studies were about of efficiency of phytochemicals, juice, peel and oil of pomegranate in the treatment and prohibition of tubes carry eggs

RESULTS: Studies showed Phytochemicals of pomegranate can inhibit tumoral cell proliferation and apoptosis through the modulation of cellular transcription factors and signaling proteins in tubes carry eggs, as well as, results suggested pomegranate juice, peel and oil have a lot anticancer activities, including inhibition in tumoral cell multiplication, tumoral cell cycle, invasion and angiogenesis in tubes carry eggs tumors. Analysis were based on the key role of pomegranate in anti-inflammatory affects why so pomegranate is inhibitor of inflammation and suppressor of tumor creation in tubes carry eggs

CONCLUSION: Due to this review: Phytochemicals of pomegranate and use of pomegranate juice, peel and oil can inhibit tumoral cell proliferation, tumoral cell cycle, invasion of tumoral cells, inflammation and angiogenesis in tubes carry eggs tumors because those have a lot important efficiency in inhibition of tumoral cells activities. Also Phytochemicals of pomegranate can debar apoptosis through the modulation of cellular transcription factors and signaling proteins in tubes carry eggs tumors. The phytochemistry acts of all pomegranate components suggest a wide range of clinical applications for the treatment and prohibition of tubes carry eggs, as well as other illnesses where inflammation is believed to play an necessary etiologic role.
